

## LAB 6 – A Simple Webpage

You have been given a HTML starter code. You may use any text editor of your choice to work on this week's lab.

Your task for this lab is to experiment and get familiar with HTML elements and inline CSS. You will learn more about external CSS later on.

In the starter code, you will notice a <head> and <body> element. The <head> is used as a container tag for metadata, we will not worry about it for the purpose of this lab.

Start by adding the following items to starter code in the element body

- Add a Heading and set the colour of the text to be Red.

Example: <h1 style="color:Red;"> your heading </h1>

Similarly, let's say you would like to change the background colour of the webpage to be black, you can simply replace <body> with <body style="background-color:black;">

- An image: Image can be added using the following tag 
- An unordered list of items of your choice (foods, games, movies etc). And let every item on the list to be either a link to the google search result page of the item or a link to the image of the item.

The tag used for unordered list is <ul> and each item in the list would be in <li>

```
<ul>
  <li>item1</li>
  <li>item2</li>
  ...
  <li>item n</li>
</ul>
```

You can add a link by using the following tag <a href="url"> link text </a>

Don't forget to always have a closing tag at the end.

- Finally, try and format the statement in the <p> tag in the starter code to look like the image below.

The *quick* **brown** ~~snake~~ fox **jumped** <sup>over</sup> the *lazy* dog.

Note that whenever you wish to add comments in your code, it can be added as follows

```
<!-- You comment -->
```

More information on HTML tag can be found @ <https://www.w3schools.com/html/default.asp>
